KONA LS and KONA LH/LHe  
Video Processing Amp Settings  
With Version 1.2 KONA Software

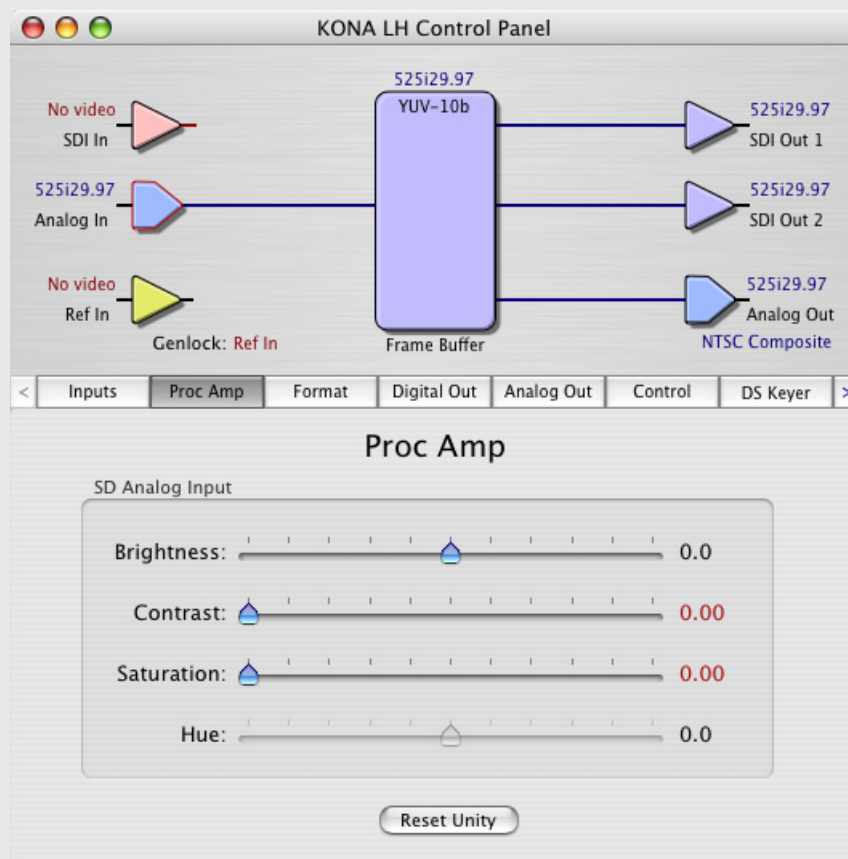

## Overview

In some cases, after installing the Kona v1.2 driver for KonaLH and KonaLS, the proper default settings for the video processing amp are not being set. An indication of this is that the video output of the board is black and white, instead of color. This occurs with analog inputs only, not digital, as the proc amp only effects the analog inputs. A second indication is shown in the control panel. The icon widget for the analog input will have a red border around it if the proc amp controls are not at unity. If your output video has no color in it and the analog input icon has a red border around it, your proc amp is not set to unity. To resolve this issue:

1. Open the control panel
2. Navigate to the Proc Amp window
3. Press the "Reset Unity" button at the bottom of the window
4. Quit the Control Panel application

The screen below shows what the proc amp controls look like when the problem occurs (note the red line around the Analog In icon):
