

# Read Me—AJA QuickTime Codec

## General

If you have need to access AJA KONA QuickTime media files, but do not have a KONA card in your Macintosh, you can use the AJA QuickTime codec to work with the clips.

## How To Install

To install the codec, simply copy all the files contained in this archive (but not the “Read Me” file) into the “/Library/Quicktime” folder on your system.

The files you’ll copy are:

- AJACodec.component
- AJAUncompressedCodec.component

## After Installation and Use

You probably will want to remove these codec files after you’ve accessed the AJA KONA media files. If you do not, they may inadvertently become the default codec by your software/hardware. Although we believe our codecs work better than others, it might confuse other users of your system or produce unexpected results on unfamiliar system configurations.
