

AJA FS1-X

Release Notes - Firmware v1.1.0.26

General

FS1-X is the next evolution in frame synchronization and conversion, integrating a wide array of video and audio connectivity and processing into a slim, 1RU form factor.

FS1-X is available in two configurations:

FS1-X

The standard FS1-X configuration provides complete frame synchronization and up, down, cross-conversion of digital and analog signals. In addition to embedded SDI, AES and analog audio, FS1-X supports 64-channel MADl audio over fiber and coax, creating a 224 x 224 audio routing matrix. Closed Captioning and Aspect Ratio conversion are possible along with many other features and capabilities. Complete feature details are provided on the AJA website and in the FS1-X Installation and Operation Guide.

FS1-X with FRC

FS1-X with FRC combines all the capabilities of the standard FS1-X and adds a high-quality, motion adaptive linear frame rate converter (FRC) for smooth conversion between a wide range of frame rates. The FRC configuration is factory-installed, so standard FS1-X units cannot be upgraded to add FRC functionality.

Improvements

- Resolved issue with Network Discovery - This release corrects a problem with Network Discovery allowing FS1-X to correctly identify on the local network, and allowing FS1-X to communicate with a DNS server for dynamic IP Address assignment.

Additional Information
